Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                           + {DNA} (N).

**CONSISTS OF TWO SUBUNITS (258 kDa and 55 kDa).

**SUBCELLULAR LOCATION: Nuclear.

**DOMAIN: The DNA polymerase activity domain resides in the N-terminal half of the protein, while the C-terminus is necessary for complexing subunits B and C. The C-terminus may also regulate the catalytic activities of the enzyme.

**SIMILARITY: Belongs to the DNA polymerase type-B family.
                                                                                                                                                                                                                                                                                                                                                                     replication.
CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N

Groelz D., Bachmann M.;

Submitted (OCT-1956) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: La protein plays a role in the transcription of RNA
-polymerase III. It is most probably a transcription termination
factor. Binds to the 3' termini of virtually all nascent
polymerase III transcripts. It is associated with precursor forms
of RNA polymerase III transcripts including tRNA and 4.55, 55, 75,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Topfer F., Gordon T., McCluskey J.;

SUBCELLULAR LOCATION: Nuclear (Probable).
PTM: Phosphorylated (By similarity).
SIMILARITY: Contains 1 RNA recognition motif (RRM) domain.
                                                                                                                                                                       FUNCTION: La protein plays a role in the transcription of polymerase III. It is most probably a transcription termin factor. Binds to the 3' termini of virtually all nascent polymerase III transcripts. It is associated with precurse of RNA polymerase III transcripts including tRNA and 4.58.
                                                                                                                                                               and 7-2 RNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14

FUNCTION: La protein plays a role in the transcription termination polymerase III. It is most probably a transcription termination factor. Binds to the 3' termini of virtually all nascent factor. Binds to the 3' termini of virtually all nascent for polymerase III transcripts. It is associated with precursor for polymerase TII transcripts including tRNA and 4.5S, 5S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and 7-2 RNAs.
SUBUNIT: Interacts with DDX15.
SUBCELLULAR LOCATION: Nuclear (Probable).
PTM: PHOSPHORYLATED. THE PHOSPHORYLATION

It is most probably a transcription termination factor. Binds to the 3' termini of virtually all nascent polymerase III transcripts. It is associated with precursor forms of RNA polymerase III transcripts including tRNA and 4.5S, 5S, 7S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    105

CORACTOR: Binds 4 magnesium ions per subunit. Other metal ions can support activity, but at a lower rate. Two magnesium ions are required for the activation of the enzyme and are present before substrate binds, two additional magnesium ions form complexes with substrate and product (By similarity). SUBCELLULAR LOCATION: Cytoplasmic (By similarity). SIMILARITY: Belongs to the PPase family.
                                                                                                                         _TaxID=491

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polymerase III. Binds RNA and DNA. Binds to the 3' end of the minus strand of Sindbis virus RNA. This may be significant for Sindbis virus RNA replication.

J. MOL. Biol. 231:196-204(1993).

-I- FUNCTION: La protein plays a role in the transcription of RNA
polymerase III. It is most probably a transcription termination
factor. Binds to the 3' termini of virtually all nascent
polymerase III transcripts (By similarity).
-I- SUBCELLUIAR LOCATION: Nuclear (Probable).
